Abstract of the Disclosure

5 A pavement rejuvenating and/or conditioning  
composition in which particular coal tar derivatives and  
other optional ingredients are supplemented with an  
elastomeric constituent. A rejuvenating or conditioning  
composition containing an elastomer will reliably hold in  
place a top layer of fine aggregate, whereas a rejuvenating  
or conditioning composition without elastomer does not, and  
also allows for early restoration of traffic, prompt  
10 resistance to rain, and good repair and wear resistance of  
and in the pavement to be maintained. The elastomer is  
preferably acrylonitrile-butadiene polymer although other  
polymers can also be substituted including natural and  
nitrile-rubbers, polyorganosiloxane and, less preferably,  
15 styrene-butadiene, neoprene- and polybutadiene polymers.
